Assignment Semester 2 2026 – Marking Rubric

Marking Rubric

The following rubric outlines the specific standards required for each question in the assignment. Criteria designated as 'hurdle' in the left most column are those that must be met to gain a certain grade (usually either a grade of 2 or 3). Criteria designated as 'differentiator' in the left most column are those that help to distinguish between assignment responses at each rubric grade.

Weight	Significantly above pass level	Above pass level	Pass level	Below pass level	Significantly below pass level
Question	5	4	3	2	1
1a 7%	Assess LLM classification quality				
Holistic	Very strong ability to assess an LLM classification pipeline	Good ability	Some ability	Limited ability	Does not demonstrate ability
Hurdle (for a 2)	Examines a sample of ≥ 20 classifications against the original 8-K filing text and states what the examination found.				Does not examine classifications against the original filing text, or does not state what the examination found.
Hurdle (for a 3)	Conducts both analyses (accuracy against filing text AND label-vs-return comparison).			Conducts only one of the two analyses, or neither.	
Differentiator	Identifies systematic patterns across the whole sample, with specific evidence from the filings, and separates disagreement over where a category boundary falls from outright misreading of the filing	Cites specific evidence from the filings on the accuracy of the sampled classifications and on whether the boundaries between adjacent categories were applied the same way from one filing to the next, and begins to identify patterns across the sample	Selects a stratified random sample covering all six documented outcome categories, and cites specific evidence from the filings on the accuracy of each sampled classification and on whether the boundaries between adjacent categories were applied the same way from one filing to the next	Examines a sample but offers general observations rather than specific evidence from the filings, or the sample does not cover all six documented outcome categories	Does not examine the classifications against the filings, or states concerns about the classifications without examining them

Weight	Significantly above pass level	Above pass level	Pass level	Below pass level	Significantly below pass level
Question	5	4	3	2	1
Differentiator	Systematically distinguishes LLM errors from market pricing effects by reading underlying filings, with quantified disagreement rates by category	Investigates disagreements with filing reading; quantifies rates; recognises that disagreement does not always mean LLM error	Computes disagreement rates, reads a selection of disagreement cases, and offers plausible explanations	Notes that disagreements exist but does not investigate individual cases or quantify rates	Does not compare labels to returns
Differentiator	Connects specific design choices in the methodology document to observed issues in the evaluation	References the methodology document and connects at least one design choice to an observed pattern	References the methodology document and accurately describes the classification approach	Mentions the methodology document but description is inaccurate or superficial	Does not reference the methodology document
1b	5%	Construct flagging pipeline			
Holistic	Very strong ability to construct an approach for flagging unreliable classifications	Good ability	Some ability	Limited ability	Does not demonstrate ability
Hurdle (for a 2)	Applies a flagging approach to all classifications in consensus_outcomes and reports how many or what proportion are flagged.				Does not apply the approach to all classifications in consensus_outcomes, or does not report how many or what proportion are flagged.
Hurdle (for a 3)	Flagging approach is explicitly informed by the student's own findings from Question 1a.			Flagging approach is generic and not connected to the student's own Question 1a findings.	
Differentiator	Combines multiple signals from Question 1a with justified thresholds in a programmatic approach, and prioritises the flagged classifications by how much the downstream analysis stands to gain from reviewing each	Uses multiple signals from Question 1a in a programmatic flagging approach with some justification for the thresholds, and bases the order of review on the patterns observed	Uses at least two signals from Question 1a in a programmatic flagging approach, and states which flagged classifications should be reviewed first and why	Uses one signal from Question 1a, or logic is present but thresholds are unreasonable, or no order of review is stated	No flagging approach is submitted, or no workable flagging logic is present

Weight	Significantly above pass level	Above pass level	Pass level	Below pass level	Significantly below pass level
Question	5	4	3	2	1
Differentiator	Evaluates which parts of the dataset are most and least reliable, with implications for downstream analysis	Reports how many and what proportion are flagged in each outcome category, with some discussion of downstream implications	Reports how many and what proportion of classifications are flagged, broken down by outcome category	Reports total flagging rate only, without breakdown by category	Does not report the flagging results, or reports them in a form that cannot be followed
1c	5%	Clean data, vectorise text fields			
Holistic	Very strong ability to clean data and vectorise text for downstream use	Good ability	Some ability	Limited ability	Does not demonstrate ability
Hurdle (for a 2)	Applies cleaning to the data, and produces a word or sentence embedding vectorisation of the text without errors.				No cleaning is applied, or no word or sentence embedding vectorisation is produced, or it contains errors.
Hurdle (for a 3)	Dimensionality reduction is applied to the vectorisation.			No dimensionality reduction is applied.	
Differentiator	Justifies the cleaning decisions, including what was deliberately left alone, by what this data requires and how the features are used	Distinguishes the issues that affect the downstream use from those that do not, and cleans accordingly	Examines the data before deciding what to clean, and applies cleaning targeted at what the examination showed	Applies generic cleaning steps without examining the dataset's specific issues	No meaningful cleaning or cleaning introduces errors
Differentiator	Explains how the approach should differ between the descriptive use in Question 2 and the cross-validated use in Question 3, and justifies the features finally used against both	Identifies that the Question 2 and Question 3 uses place different demands on the features, including for leakage, and shows what was done about the difference	Takes reasonable steps to avoid leakage, and explains how the features finally used were checked as fit for the Question 2 and Question 3 uses	Mentions leakage or the two downstream uses, but the steps taken are incomplete or incorrect	Does not address leakage or the fitness of the features, or introduces leakage without identifying it
1d	4%	Summarise LLM assessment			
Holistic	Very strong ability to communicate classification reliability findings to a business audience	Good ability	Some ability	Limited ability	Does not demonstrate ability

Data Science Applications Assignment Semester 2 2026 – Marking Rubric

Weight	Significantly above pass level	Above pass level	Pass level	Below pass level	Significantly below pass level
Question	5	4	3	2	1
Hurdle (for a 2)	Within 500 words. Uses correct spelling and grammar.				Over 500 words, or contains material spelling and/or grammar mistakes.
Hurdle (for a 3)	Summary covers both the assessment of the classifications and the flagging approach.			Covers only one of them, or neither.	
Differentiator	Recommends specific actions the IR team should take in light of the reliability findings, with rationale	Explains in concrete terms how the reliability of the classifications affects the IR team's estimates of market reactions	Reaches a verdict on whether the classifications are fit for the IR team to rely on, supported by where they are weakest and whether that weakness matters for the estimates	Reports findings from the assessment or the flagging approach but reaches no verdict on fitness, or does not connect the findings to the IR team's estimates	No findings are reported, or the findings are not based on the evaluation undertaken or are incorrect
Differentiator	Highly suitable for the IR team, no edits required before sharing	Suitable, only minor edits required	Mostly suitable for the IR team. Plain language, main points followable. Occasional lapses into jargon or unclear phrasing.	Mostly not suitable for the IR team	No summary is submitted, or it is not suitable for any non-technical audience
2a	8%	Clustering			
Holistic	Very strong ability to construct a clustering of trials and reason about what it supports	Good ability	Some ability	Limited ability	Does not demonstrate ability
Hurdle (for a 2)	Accurately applies a clustering algorithm using both text features and structured trial characteristics.				Errors, or uses only one of the two required feature types.
Hurdle (for a 3)	Examines clustering outputs using internal validation, reports the measure, and compares at least one choice to an alternative.			No internal validation; or the measure is not reported; or no comparison to alternatives.	

Weight	Significantly above pass level	Above pass level	Pass level	Below pass level	Significantly below pass level
Question	5	4	3	2	1
Differentiator	Justifies features, algorithm, distance measure, and number of clusters against the alternatives considered, grounding each in how the groupings are to be used to identify comparables	Justifies all four choices with comparison to at least one alternative, including how the number of clusters serves the use of the groupings to identify comparables	Justifies features, algorithm, distance measure, and number of clusters with correct reasoning, including how the number of clusters serves the use of the groupings to identify comparables	Justifies some choices with correct reasoning but key decisions (e.g. number of clusters or distance measure) are unjustified or only partially correct	Presents no choices, or states choices without justification, or the justification is incorrect
Differentiator	Establishes what the internal validation measure can and cannot support (for example by comparing it across alternative feature representations, against a randomised baseline, or against a grouping obtainable from the data without clustering), and reflects the result in the configuration chosen	Tests the internal validation measure against at least one alternative representation or randomised baseline, and interprets the result	Interprets the internal validation measure, stating what it does and does not show about the grouping, without testing it further	Reports the internal validation measure with only general interpretation	Reports no internal validation measure, reports it without interpretation, or treats it as evidence of structure it cannot support
Differentiator	Quantifies the limit the cluster size distribution places on what the groupings can support, and identifies which uses remain sound within that limit	Relates the cluster size distribution to how much weight the groupings can carry when they are used to identify comparables	Discusses what the cluster size distribution implies for how the groupings can be used	Reports the cluster size distribution without discussing what it implies for use	Does not report the cluster size distribution, or reports it incorrectly
2b	4%	Discriminator modelling			
Holistic	Very strong ability to build and interpret a discriminator model	Good ability	Some ability	Limited ability	Does not demonstrate ability
Hurdle (for a 2)	Constructs a TF-IDF vectorisation of the filing text and accurately applies a random forest algorithm to it.				No TF-IDF vectorisation of the filing text, or errors in application.
Hurdle (for a 3)	Accurately calculates variable importance for individual terms.			Errors in variable importance, or importance is not reported for individual terms.	

Weight	Significantly above pass level	Above pass level	Pass level	Below pass level	Significantly below pass level
Question	5	4	3	2	1
Differentiator	Presents the ten most distinguishing keywords for each cluster and draws supported conclusions from them about cluster validity and composition	Presents the ten most distinguishing keywords for each cluster and interprets what they show about how the clusters differ	Presents the ten keywords that most distinguish each cluster, with correct per-cluster breakdown	Presents variable importances without a per-cluster breakdown, or with errors in interpretation	Presents no variable importances, or the importances presented are incorrect or not connected to clusters
2c	4%	Manual validation			
Holistic	Very strong ability to examine clustering outputs	Good ability	Some ability	Limited ability	Does not demonstrate ability
Hurdle (for a 2)	Examines the clustering outputs using manual validation, with at least one approach beyond the discriminator keywords from Question 2b.				No manual validation, or manual validation uses only the discriminator keywords from Question 2b.
Differentiator	Validates clusters using at least three distinct analyses drawing on diverse variables including market reaction data and sponsor characteristics, and checks whether any cluster is an artefact of data availability rather than of trial characteristics	Validates clusters using at least three distinct analyses drawing on variables beyond the text fields	Validates clusters using at least three distinct analyses that go beyond the discriminator keywords from Question 2b	Validates clusters using only one or two distinct analyses beyond the discriminator keywords from Question 2b, or the analyses are not clearly distinct	Provides no manual validation, uses only the discriminator keywords from Question 2b, or the validation approach is flawed
Differentiator	Interprets each cluster in business terms with a strong link to how the groupings are to be used to identify comparables, and gives an intuitive label to every cluster that supports one	Interprets the key characteristics of each cluster from the validation analyses, with a clear link to how the groupings are to be used to identify comparables; labels most clusters	Describes, from the validation analyses, what distinguishes each cluster or where clusters are not clearly distinct, with some connection to how the groupings are to be used to identify comparables	Describes cluster characteristics from the clustering output but does not connect them to how the groupings are to be used to identify comparables	No description of the clusters is offered, or descriptions are not based on the clustering output or are fundamentally incorrect
2d	4%	Summarise cluster analysis			
Holistic	Very strong ability to communicate cluster analysis findings to a business audience	Good ability	Some ability	Limited ability	Does not demonstrate ability

Data Science Applications Assignment Semester 2 2026 – Marking Rubric

Weight	Significantly above pass level	Above pass level	Pass level	Below pass level	Significantly below pass level
Question	5	4	3	2	1
Hurdle (for a 2)	Within 500 words. Uses correct spelling and grammar.				Over 500 words, or contains material spelling and/or grammar mistakes.
Differentiator	Recommends what the IR team should and should not use the groupings for, grounded in the variation measured and the uncertainty around it	Summarises the groupings, supports the amount of variation reported with an appropriate comparison or measure of uncertainty, and draws a conclusion on reliance that follows from what was measured	Summarises the main groupings, how much of the variation in observed market reactions they account for, and whether that is enough for the IR team to rely on them for that purpose	Summarises the groupings but does not state how much of the variation in observed market reactions they account for, or does not state whether that is enough for the IR team to rely on them for that purpose	No summary of the groupings is submitted, or the summary is not based on the clustering analysis or is incorrect
Differentiator	Highly suitable for the IR team, no edits required before sharing	Suitable, only minor edits required	Mostly suitable for the IR team. Plain language, main points followable. Occasional lapses into jargon or unclear phrasing.	Mostly not suitable for the IR team	Not suitable for any non-technical audience
3a	7%	Construct feature set for magnitude prediction			
Holistic	Very strong ability to construct a feature set for predictive modelling spanning trial, text and company data	Good ability	Some ability	Limited ability	Does not demonstrate ability
Hurdle (for a 2)	Constructs features from at least two of the three required groups (trial/outcome, text-based, company/market context).				Features constructed from fewer than two of the three required groups.
Hurdle (for a 3)	Constructs features from all three required groups, with at least two text representation approaches.			Missing a feature group or only one text approach.	

Weight	Significantly above pass level	Above pass level	Pass level	Below pass level	Significantly below pass level
Question	5	4	3	2	1
Differentiator	Justifies feature engineering decisions across all three groups, and explains why the treatment chosen for filings covering more than one trial and for missing data was preferred to the alternatives	Explains the construction choices in each group with reasons connected to the prediction task, and describes a considered treatment of filings covering more than one trial and of missing data	Explains what was constructed in each group and why, and states how filings covering more than one trial and missing data were treated	Lists the features constructed without explaining the choices made, or does not say how filings covering more than one trial or missing data were treated	Gives no account of what was constructed in any feature group
Differentiator	Justifies the observation window behind each feature against the filing date, and shows that the whole feature set could be rebuilt as at that date from the sources used	Describes where each feature came from and the window of data behind it relative to the filing date, and shows that each feature was observable before the market reaction	States how the features in each group were time-matched to the filing date, and addresses whether they were observable before the market reaction	Time-matching to the filing date is described for some features but not others, or whether the features were observable before the market reaction is not addressed	Gives no account of how any feature was matched to the filing date
3b	10%	Select, justify, and construct magnitude prediction models			
Holistic	Very strong ability to select, justify, build, evaluate, and interpret predictive models	Good ability	Some ability	Limited ability	Does not demonstrate ability
Hurdle (for a 2)	Fits at least one model predicting the signed CAR with cross-validated performance reported.				No model fitted or no cross-validation.
Hurdle (for a 3)	Compares at least two model families with cross-validation, and reports standard regression metrics.			Fewer than two model families, no comparison between them, no cross-validation, or no standard regression metrics.	
Differentiator	Justifies each model family by connecting its strengths to specific characteristics of this dataset, and rules out an alternative on the same evidence	Justifies each model family with reference to the characteristics of this data, and rejects an alternative on grounds drawn from those characteristics	Justifies each model family with a correct reason relevant to this prediction task, and names an alternative that was considered and why it was not used	Justifies model choice with reasoning that connects to the prediction task but is only partially correct, covers only one model family, or names no alternative that was considered	No justification is given for the model families chosen, or the reasoning given is incorrect or irrelevant

Weight	Significantly above pass level	Above pass level	Pass level	Below pass level	Significantly below pass level
Question	5	4	3	2	1
Differentiator	Interprets what the metrics and the practical evaluation of discriminatory power together say about how far these predictions can be relied on, and designs the cross-validation around the structure of this data rather than defaulting to it	Evaluates both model families using multiple regression metrics and at least one practical evaluation of discriminatory power, with cross-validation appropriate to the structure of this data	Evaluates both model families using appropriate cross-validation and standard regression metrics with at least one practical evaluation of discriminatory power	Fits the models with cross-validation and reports standard metrics but presents no practical evaluation of discriminatory power	Presents no evaluation of the models beyond fitting them, or the evaluation presented has significant flaws
Differentiator	Conducts systematic ablation showing the marginal contribution of each feature group, and interprets which groups add predictive value, including where they overlap	Ablates each feature group in turn rather than the text group alone, and interprets what the differences mean for whether the language of the disclosure adds anything	Discusses which feature groups contribute most, and reports how much the text features add beyond the trial, outcome and company features	Examines feature importance for this dataset but discusses individual features rather than feature groups, or does not report how much the text features add	Presents no analysis of which features or feature groups contribute, or the interpretation offered is incorrect
Differentiator	Identifies specific leakage risks in this dataset, explaining how each was found and why it constitutes leakage, and demonstrates the difference they made to model performance, or would have made if they had been included	Identifies at least one specific leakage risk, explaining how it was found and why it constitutes leakage, and demonstrates the difference it made to model performance, or would have made if it had been included	Identifies at least one feature in this dataset that could constitute leakage, and says how it was found and what difference it made to the model, or would have made if it had been included	Identifies a feature in this dataset as potential leakage but the explanation of why it constitutes leakage is incomplete, or does not say how it was found, or does not say what difference it made or would have made	Does not discuss leakage, or mentions leakage but the understanding is incorrect or the features identified are not actually leakage
3c	6%	Examine predictability across outcome groups			
Holistic	Very strong ability to examine and interpret heterogeneity in model performance	Good ability	Some ability	Limited ability	Does not demonstrate ability
Hurdle (for a 2)	Compares model performance across at least two outcome groups (e.g. positive vs negative).				No within-outcome comparison.

Weight	Significantly above pass level	Above pass level	Pass level	Below pass level	Significantly below pass level
Question	5	4	3	2	1
Hurdle (for a 3)	Reaches a conclusion, supported by the within-outcome metrics reported, on whether predictability differs across outcome groups.			No conclusion is reached on whether predictability differs, or the conclusion is not supported by the within-outcome metrics reported.	
Differentiator	Establishes clearly, using multiple within-outcome metrics, whether and how far predictability differs across outcome groups, and examines whether that finding is robust rather than taking it at face value	Compares performance across outcome groups using more than one within-outcome metric and states clearly whether and how far predictability differs	Evaluates performance within positive and negative outcome groups using at least one appropriate metric, and interprets those metrics correctly	Comments on whether performance differs but does not support the comment with within-outcome metrics, or reports within-outcome metrics but draws no supported conclusion from them	Does not compare performance across outcome groups, or the comparison is methodologically flawed or the interpretation is incorrect
Differentiator	Connects the pattern the metrics show to specific concepts from finance or behavioural economics and discusses implications for the CFO's confidence across different scenarios	References at least one relevant concept and notes implications for the estimates in Question 4	Offers a plausible explanation for the pattern the metrics show, based on general reasoning	Explanation is offered but is vague or not connected to the evidence	No explanation offered or explanation contradicts the evidence
3d	4%	Summarise magnitude prediction findings			
Holistic	Very strong ability to communicate predictive modelling findings to a business audience	Good ability	Some ability	Limited ability	Does not demonstrate ability
Hurdle (for a 2)	Within 500 words. Uses correct spelling and grammar.				Over 500 words, or contains material spelling and/or grammar mistakes.
Differentiator	Recommends how confident the CFO should be in using the magnitude predictions to narrow the range of scenarios, with specific reasoning grounded in model performance and limitations	Connects those findings and their key limitations to the CFO's decision in concrete terms	Summarises how much of the variation in market reactions the model explains and which feature groups contribute most	Summarises findings but omits the model's explanatory power or feature-group contribution	No summary is submitted, or the summary is not based on the analysis undertaken or is incorrect

Weight	Significantly above pass level	Above pass level	Pass level	Below pass level	Significantly below pass level
Question	5	4	3	2	1
Differentiator	Highly suitable for the IR team, no edits required before sharing	Suitable, only minor edits required	Mostly suitable for the IR team. Plain language, main points followable. Occasional lapses into jargon or unclear phrasing.	Mostly not suitable for the IR team	Not suitable for any non-technical audience
4a 10%	Estimate market reactions for Asclepius's readouts				
Holistic	Very strong ability to apply imperfect analytical tools to specific cases with professional judgment and honest uncertainty	Good ability	Some ability	Limited ability	Does not demonstrate ability
Hurdle (for a 2)	Presents estimates for at least one of Asclepius's readouts using outputs from Q2 or Q3, under at least one outcome scenario.				No estimates presented or no connection to prior analysis.
Hurdle (for a 3)	Presents estimated CAR ranges for at least two of the three readouts, under at least positive, negative and mixed scenarios, AND discusses at least one source of uncertainty or evidence limitation.			Fewer than two readouts, only one scenario, or no discussion of uncertainty.	
Differentiator	Identifies precisely which features are available, supplied and absent for an unreported trial; refits or re-scopes with a stated justification; and quantifies the cost by ablation against the Question 3 model	Identifies availability correctly and refits with justification; cost stated qualitatively	Identifies availability correctly and produces estimates from what is available; no attempt to quantify what was lost	Notes availability but applies the Question 3 model unchanged, as though nothing were missing	Does not address availability, or substitutes text without acknowledging the substitution
Differentiator	States a range per readout and scenario, decomposes its width into outcome uncertainty and model limitation, and gives the CFO a defensible confidence statement. A well-evidenced conclusion that the model cannot separate scenarios beyond its own variability scores here	States a range with uncertainty and identifies the main driver of its width	States a range with some acknowledgement of uncertainty	States a range but presents it as a forecast	Quotes a point estimate, or a range narrower than the evidence supports

Weight	Significantly above pass level	Above pass level	Pass level	Below pass level	Significantly below pass level
Question	5	4	3	2	1
Differentiator	Distinguishes the three readouts by evidence quality with specifics — comparable counts, which outcome categories are represented, which are absent — and carries that into differential confidence	Distinguishes the readouts by evidence quality with some specifics	Notes that evidence quality differs across readouts	Treats all three readouts as equally well supported	No consideration of evidence strength
4b	4%	Validation, monitoring, and refresh plan			
Holistic	Very strong ability to design a practical plan for validating, monitoring, and refreshing a deployed pipeline	Good ability	Some ability	Limited ability	Does not demonstrate ability
Hurdle (for a 2)	Identifies at least one action for validating, monitoring, or refreshing the pipeline.				Identifies no action for validating, monitoring, or refreshing the pipeline.
Hurdle (for a 3)	Proposes at least one recommendation that references a specific characteristic of this pipeline or dataset.			All recommendations are generic.	
Differentiator	Evaluates risks specific to this pipeline and proposes practical mitigations for validation, monitoring, and refresh	Identifies risks specific to this pipeline and proposes recommendations grounded in the assignment context for validation, monitoring, and refresh	Proposes recommendations covering validation, monitoring, and refresh	Addresses only one or two of validation, monitoring, and refresh, or describes generic actions without connecting them to this pipeline	Does not address validating, monitoring, or refreshing the pipeline
4c	3%	Advise the IR team on presenting the analysis			
Holistic	Very strong ability to advise a non-technical team on presenting an imperfect model to a decision-making audience	Good ability	Some ability	Limited ability	Does not demonstrate ability
Hurdle (for a 2)	Within 300 words. Identifies at least one thing the team should present, or one thing it should hold back.				Over 300 words, or identifies nothing to present or hold back.

Data Science Applications Assignment Semester 2 2026 – Marking Rubric

Weight	Significantly above pass level	Above pass level	Pass level	Below pass level	Significantly below pass level
Question	5	4	3	2	1
Hurdle (for a 3)	Addresses how the team should respond to pressure for a narrower range than the evidence supports. Written in language appropriate for a non-technical audience.			Does not address pressure for greater precision, or language is overly technical.	
Differentiator	Selects what to put to the board and what to keep in the background with reasons drawn from the student's own findings, and gives the team a defensible position to hold when pressed for more precision than the analysis supports	Selects what to present and what to hold back with reasons drawn from the analysis, and states how the team should respond to pressure for a narrower range	States what the team should present and what it should hold back, and offers a response to pressure for more precision, with at least one reason drawn from the student's own analysis	Advises on presentation in general terms, or the reasons given are generic rather than drawn from the student's own analysis	Offers no advice on what to present, or advises overstating what the analysis supports
5	15%	Professional handover			
Holistic	Very strong ability to present professional ownership of the work	Good ability	Some ability	Limited ability	Does not demonstrate ability
Hurdle (for a 2)	A video of between 3 and 5 minutes, delivered speaking to camera, is submitted; and the AI log file generated by the provided script is submitted, or the video states that no AI tools were used.				No video; video under 3 minutes or over 5 minutes; video not delivered speaking to camera; or no AI log file is submitted and the video does not state that no AI tools were used.
Hurdle (for a 3)	The video, the notebook and AI logs submitted tell one consistent story.			Notable inconsistencies between the account given and the submitted work, or the account of AI use is not supported by the submitted log.	
Hurdle (for a 4)	Does not appear to be reading word for word from a script.		Appears to be reading word for word.		
Differentiator	Presents a clear, well-evidenced opinion on what the analysis supports and where it should not be relied upon, pitched to what the reviewing actuary needs in order to rely on the work	States a clear opinion on both what the analysis supports and where it should not be relied upon, with supporting evidence from the notebook. The selection of evidence or the pitch to the reviewer is less sharp.	States an opinion on what the analysis supports and where it should not be relied upon, with at least one supporting result from the notebook	Opinion covers only what the analysis supports or only where it should not be relied upon, or is asserted with little support from the notebook	No opinion is given, or the opinion is not connected to the analysis

Data Science Applications Assignment Semester 2 2026 – Marking Rubric

Weight	Significantly above pass level	Above pass level	Pass level	Below pass level	Significantly below pass level
Question	5	4	3	2	1
Differentiator	Discloses the nature and extent of any reliance against their responsibilities under Practice Guideline 1, and identifies specific, well-chosen points where their own examination changed the work	Discloses any reliance and describes genuine examination and verification of the work, connecting their responsibilities under Practice Guideline 1 to what they actually did. Minor gaps in depth.	Accounts for how the work was produced and how they satisfied themselves it is sound, by reference to their responsibilities under Practice Guideline 1. Disclosure and verification are present but limited.	Account is generic or largely passive, with little evidence of examination or verification, or is not framed by reference to Practice Guideline 1	No meaningful account of how the work was produced
Total	100%				

Students are advised that a mark of zero (0) will be allocated for any question (or sub-question) where there is no attempt made, or the marker finds the attempt is completely unsatisfactory.
